The USB Type-C connector is currently in the process of being standardized by the USB Implementers Forum (USB-IF) and is expected to appear in USB cables and connectors

sometime in 2015. USB-IF has recently announced that its new Type-C USB 2.0 Hi-Speed Battery Charge (AC/R) specification, has been approved and that it is due to become a USB 3.0 revision specification in 2015. The availability of a USB 3.0 Hi-Speed (Type-C) connector has advantages over previous versions as the advantage of battery charging from the USB

Field of the Invention The present invention relates to a liquid crystal display (LCD) device and, more particularly, to an LCD device including a light emitting diode (LED) used as a backlight source. 2. Discussion of the Related Art In general, a liquid crystal display (LCD) device is widely used as a flat panel display because it provides a lightweight and slim profile display with superior color reproduction. The LCD device may include an LCD panel in which liquid crystal cells are arranged in a matrix, and a driving circuit for driving the LCD panel. The LCD panel is driven using a liquid crystal driving scheme, such as an inversion driving scheme, a dot inversion driving scheme, an on-off driving scheme, etc. In the inversion driving scheme, an inversion voltage is applied to a liquid crystal cell once during a frame period. In contrast, in the dot inversion driving scheme, a non-inversion voltage is applied to two adjacent liquid crystal cells simultaneously during the frame period. In the on-off driving scheme, a liquid crystal cell is turned on during an entire frame period, and is turned off in another frame period. The LCD panel may include a common electrode and a plurality of pixel electrodes to apply a voltage to the liquid crystal cells. Each of the pixel electrodes applies a pixel voltage corresponding to data in synchronization with a horizontal synchronization signal. The liquid crystal cells are driven by an electric field generated between the pixel electrode and the common electrode. The driving circuit includes a gate driver for supplying a gate pulse to each gate line for sequentially driving the liquid crystal cells in an active matrix type LCD panel, a data driver for supplying an analog signal to each data line for transferring a data to the liquid crystal cells, a timing controller for controlling the gate driver and the data driver, etc. The LCD device has a high fabrication cost due to the use of a high resolution TFT (thin film transistor) as

the switching element of the LCD panel. As
